CIRLET / TEAM PRACTICE

Review a QR-code request

Read each fictional case. Write what is known, what is unknown, and what you would do next. Then compare your answers with the separate key.

No codes or links to scan. These cases were prepared with AI assistance.

Q1 An unexpected document

A message appears to come from a carrier contact. It says a renewal document is waiting and asks a producer to scan a QR code on their phone. The producer was not expecting the request. The message includes a phone number for questions.

What can you confirm? What needs checking, and which route would you use?

Q2 A setup you started

A staff member starts an agency-approved sign-in setup through the approved portal. The setup instructions show a QR code on the screen. The staff member recognizes the steps from the agency's instructions.

What makes this different from Q1? What if a later screen or request does not match the instructions?

What happened after the scan?

Q3 A scan already happened

A coworker says they scanned a QR code from an unexpected message with their personal phone. They do not know whether a page opened, whether they entered a password or approved a sign-in, or whether anything downloaded. They are also unsure whether a payment was submitted.

What is known? What must remain unknown? Who needs to hear about it, and what should the coworker report?

Keep the exercise private

Keep completed responses and internal contact details in an agency-approved location, not in a public repository or its issues. Do not put passwords, recovery codes or customer records in the worksheet.

These are invented discussion cases, not a security test, an agency incident or a model result.

No blanket open-source or data-reuse license is supplied.
